Rickard Sörlin

AI Product Manager | Industrial Digital Platforms (SCADA / HVAC / IoT / Energy / AI)

Bridging business, industrial operations, technology, and AI to turn real-world challenges into scalable digital platform products.

Stockholm, Sweden sorlin79@gmail.com 0730 795 308 linkedin.com/in/rickardsorlin/

Nordic Technical Support Expert · Developing toward Product & Offer Management

PROFILE

AI Product Manager by professional direction and Nordic Technical Support Expert by current role, with 20+ years across BMS/HVAC, IoT/IIoT, energy and mission-critical environments. Combines industrial domain depth with applied AI and product management to validate real user problems and shape feasible, viable solutions.

Experienced in end-to-end technical ownership and cross-functional work with Product Owners, R&D, engineering and sales. Postgraduate studies in AI, product management, strategy and business models reinforce this practice.

KEY STRENGTHS

• 20+ years across industrial digital platforms, connected systems, SCADA and mission-critical environments, combined with hands-on applied AI.

• Starts from the customer's problem: discovery, requirements, prioritisation and feasibility before committing to a solution.

• Turns recurring field issues into structured product feedback and enhancement proposals with Product Owners and R&D.

• Makes technology, constraints and trade-offs understandable across business, engineering, R&D, sales and customers.

CORE SKILLS

Product & Strategy: Product management & strategy · Requirements engineering & prioritisation · Product lifecycle thinking · Stakeholder alignment & cross-functional collaboration · Technical-

commercial trade-off analysis · B2B enterprise platforms & business models

Product Discovery & UX: Product discovery & problem validation · User interviews & workflow analysis · Wireframing & Figma prototyping · Usability evaluation

AI & Data: Generative AI, LLMs, RAG & GraphRAG · Agentic AI & multi-agent systems · Time-series forecasting & predictive analytics · Deep learning & computer vision · Data-driven decision support · AI governance, limitations & trade-offs

Platforms & Domain: Industrial digital platforms (SCADA, BMS, EMS) · Building automation, HVAC & energy systems · Connected systems (PLC, IoT, IIoT) · Real-time monitoring, control & industrial communication protocols

AI Frameworks & Tools: Python · PyTorch · scikit-learn · LangChain · LangGraph · LangSmith · RAGAS

Data & Retrieval: SQL · NoSQL · GraphDB · Knowledge graphs · Vector databases · Information retrieval

SELECTED PRODUCT & AI PROJECTS

Talking SCADA — Academic Product Case

University of Skövde → Blekinge Institute of Technology · Aug 2025 – May 2026

Explored how AI could let a building explain hidden energy waste, likely causes and useful next investigation steps in plain language while keeping operational decisions with people.

• Framed the user problem, intended users and Jobs to Be Done for building operators, facility managers and energy teams.

• Developed the concept from discovery through product definition, a bounded read-only MVP, PRD and SRD, requirements traceability and Cost-Value-Risk prioritisation.

• Connected customer and business value through Software Value Map, Business Model Canvas, packaging, sourcing and staged commercialisation planning.

• Defined the next validation step with representative users and real building data; intended energy, cost and emissions gains remain unmeasured.

Technical context: Conceptual multi-agent decision support using operational time-series data, building-system relationships and domain context; a design direction to compare with simpler support.

AI-Powered Troubleshooting Assistant

Mälardalens Industrial Technology Center (MITC)

Explored how an AI-enabled assistant could reduce downtime in industrial environments by translating machine signals, alarms, and documentation into actionable insights.

• Conducted discovery interviews with operators and testbed teams to understand workflows and identify key pain points.

• Defined and validated the core problem: dependency on specialist knowledge during incidents.

• Designed and prototyped an AI assistant providing root-cause insights and step-by-step guidance.

• Evaluated usability and user value through real-world testing with industrial partners.

• Demonstrated how AI-supported decision guidance enabled faster incident resolution and reduced reliance on specialists.

Technical context: RAG-based architecture, OPC UA integration, industrial control systems.

Uncertainty-Aware 48-hour Wind Power Forecasting

Thesis — Mälardalen University & Electrification Hub

Explored how AI-driven forecasting supports decision-making under uncertainty in energy systems.

• Identified decision-making under uncertainty as a key challenge for energy planning and operations.

• Developed a data-driven forecasting solution using real-world wind and weather data.

• Delivered probabilistic forecasts supporting planning, optimisation, and flexibility scenarios.

• Demonstrated how uncertainty-aware forecasts enable improved planning, load balancing, and energy optimisation.

Technical context: Temporal Fusion Transformer with probabilistic forecasting.

PROFESSIONAL EXPERIENCE

Nordic Technical Support Expert — Building Management Systems

OCT 2026 – PRESENT

Schneider Electric

Nordic responsibility for complex technical escalations and customer feedback across EcoStruxure Building Operation and Edge IoT controllers, connecting customer and partner needs with product quality and continuous improvement.

• Translate recurring field issues, customer and partner feedback, and operational needs into structured product insights, quality requirements and enhancement proposals.

• Collaborate with Customer Satisfaction & Quality (CS&Q), Global Expert Support and R&D to assess product defects, recurring quality trends and enhancement opportunities, providing prioritisation input based on customer impact, technical risk and business relevance.

• Act as Nordic technical expert for designated strategic global customers in the data centre, pharmaceutical and healthcare sectors, clarifying business-critical operational requirements and addressing complex product issues.

• Support root cause investigations, follow up corrective actions and validate implemented solutions in collaboration with CS&Q and R&D, feeding verified findings back into continuous product improvement.

• Mentor and guide engineers across Sweden, Norway, Denmark and Finland as an informal technical lead, sharing technical knowledge and facilitating collaboration between regional support, strategic customers, CS&Q, Global Expert Support and R&D.

Senior Technical Advisor — Digital Platforms

2020 – 2025

Schneider Electric

Led customer and technical discovery for complex digital platform solutions across healthcare, pharmaceutical, data-centre and other mission-critical environments.

• Developed and presented technical solution proposals to internal management, sales and customer stakeholders, weighing customer value, feasibility, lifecycle risk and cost.

• Held end-to-end technical ownership from problem definition and requirements through integration, validation and delivery.

• Aligned engineering, sales and customers around a shared solution direction; represented Schneider Electric at KTH Live-In Lab and mentored technical teams.

Support Engineer — Digital Platforms

2013 – 2020

Schneider Electric

Sweden's national technical expert for a digital building platform and its ecosystem of edge controllers, working with Product Owners, Global Product Support and R&D.

• Turned recurring field issues into structured product feedback and enhancement proposals, prioritised critical defects and validated releases with R&D.

• Owned a reusable HVAC deviation-management capability that turned operational data into actionable insight for troubleshooting and energy optimisation.

• Supported product lifecycle through release validation, deployment readiness and rollout risk assessment.

Project Engineer — Digital Platforms

2003 – 2013

Schneider Electric

Delivered digital solutions for building operation and energy optimisation in close collaboration with customers and operational teams.

• Worked with customers on discovery and requirements, translating operational needs into solution design.

• Held technical ownership from solution design through delivery and operational handover.

• Collaborated with R&D as a quality tester and mentored teams on platform capabilities.

EDUCATION

Postgraduate Studies in Product Management, Strategy & Industrial Economics

2025 – 2026

Blekinge Institute of Technology

Courses: Product Management & Portfolio Strategy, Strategy & Business Models, Leadership, Product Requirement Management, Agile Process & Project Management (Scrum).

Postgraduate Studies in Innovation Management (Advanced level)

2025 – 2026

University of Skövde

Courses: Innovation in Practice.

Postgraduate Specialisation in Artificial Intelligence (Advanced level)

Umeå University, Linköping University, Mälardalen University

Courses: Predictive Data Analytics, Natural Language Processing, Deep Learning for Industrial Imaging, Autonomous Systems.

Bachelor of Science in Computer Science — Specialisation in Intelligent Systems

2023 – 2025

Mälardalen University (MDU), Sweden

Courses: Interaction Design, Deep Learning, Machine Learning (Advanced), Ethics, Artificial Intelligence 1 & 2, Statistics, Software Engineering for AI (agile development, user stories, backlog structuring, UML, requirements prioritisation).

IoT and Automation, Upper Secondary School

Sjödals Gymnasium, Sweden
